

AI in-class assignment

Ernir Elí Ellertsson

- **What went well/poorly?**

At first everything went well, the AI did a good job doing the first part of problem 1 functional but then when it came to adding to it myself it became a problem, I had to spend a lot of time to just understand the code, which was a lot harder than expected. Problem 2, without using the AI took longer for the first part but a lot quicker for the second part.

- **If you worked in a group or got help from a teacher, how much did that help compared to the AI?**

I did not work in a group so I do not know really. Asked just one question for clarity on the project and I think the AI could not have answered that question because it did not create the project.

- **Were you able to utilize the AI as well as you think you could have?**

No not at all, I think if I put more effort into it, choose a better coding AI and prompted it better it could have given me a better result, but for a small in class project that was unnecessary.

- **Were you able to utilize your peers/teachers as well as you think you could have?**

No not at all, utilized them barely if something at all.

- **Do you think that using AI in this way will benefit you in the long run? Why?**

Not while still in school, I think if I use it this way I will not learn nor understand what I am doing, and therefore not be able to understand what the AI is doing and recognize the mistakes it makes.

- **Do you think that these assumptions will still apply to projects of greater scale, for example the final Bachelor project during your last year? What about at your first job?**

I think to start with you don't want to use AI, you want to know the roots of your own system, but as it gets bigger and the ball starts rolling, I don't see a problem with it, as long as you understand what the AI is spitting out.

- **What is your opinion, generally, about the use of AI as a learning tool on the one hand, and problem solving tool on the other?**

As I learning tool I see it as a useful but dangerous tool and the same for the problem solving tool. As long as you know the base and the mainline on what is happening it can be very useful and help you understand a lot more. But if you do not understand and do not put in the effort, it is not for you.

- **How do you think AI has/will change the way we work and learn?**

I think it will enable us to learn a lot more and quicker than before, if used right. But I also think that it will create a bigger gap between the people willing to learn vs the people who are not willing to.
